

Styling your App with NativeBase

Graphic design is an important part of App development. If you are not a graphic designer I recommend using NativeBase to style your App. NativeBase makes it easy to create a theme for your app.

Close Expo on your computer if it is already running. Create a new expo project including Nativebase with the following

```
npm install -g expo-cli # check you have the latest expo-cli
npm install -g yarn # check you have the latest yarn

expo init my-app --template expo-template-native-base
# change directory and expo start your new app
```

Now NativeBase is installed you can experiment with its Component Library here, <https://docs.nativebase.io/>
